Processes in learning and memory

Consolidation: memory fixation – reorganization (systems consolidation)

Introductory Course in Neuroscience, Wolfer, 16.03.2009

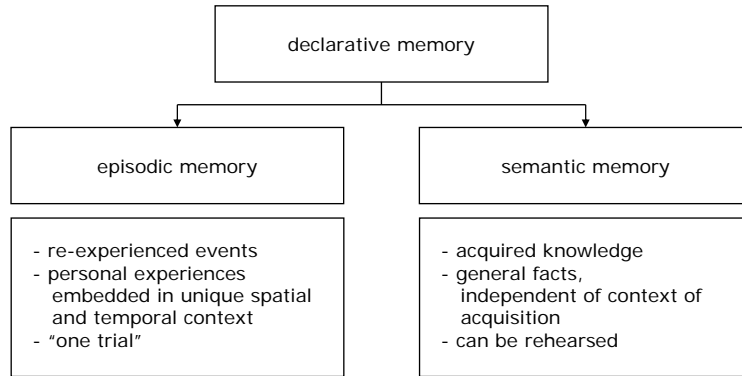

Declarative and nondeclarative memory

Often activated simultaneously!

Introductory Course in Neuroscience, Wolfer, 16.03.2009

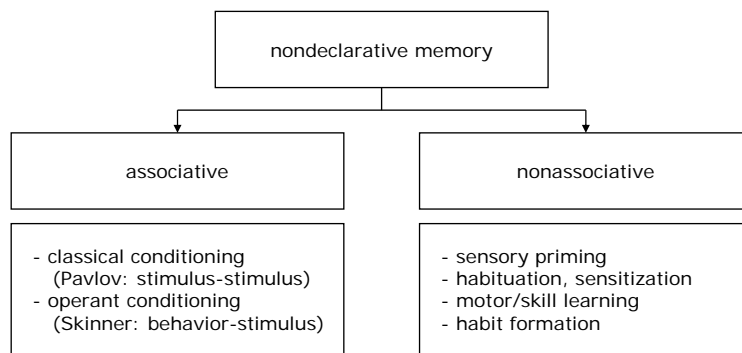

Types of declarative memory

Often activated simultaneously!

Introductory Course in Neuroscience, Wolfer, 16.03.2009

Types of nondeclarative memory

Often activated simultaneously!

Introductory Course in Neuroscience, Wolfer, 16.03.2009

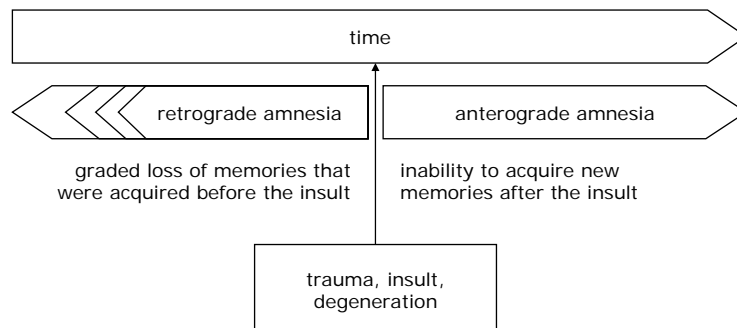

Classical (Pavlovian) conditioning

Introductory Course in Neuroscience, Wolfer, 16.03.2009

Amnesia

= loss of declarative memory function,
with preserved short-term and nondeclarative memory

Introductory Course in Neuroscience, Wolfer, 16.03.2009

Patient H.M.

- born 1926
- 1933 knocked down by bicycle
- development of uncontrollable epilepsy
- 1953 bilateral medial temporal lobe resection by William Scoville

Result:

- Seizures less frequent and controllable
- Severe amnesic syndrome:
 - complete anterograde amnesia
 - retrograde for >15y before surgery
 - nondeclarative memory spared
 - short-term memory spared
 - IQ and language normal
 - cooperative, very placid temper

Introductory Course in Neuroscience, Wolfer, 16.03.2009

Levels of analysis

Psychological level

- distinction und definition of various types of memory
- description of their properties, formalization
- models and learning theories, subject as „black box“

Systemic level

- compartmentalization and localization to different brain areas
- role of particular cell populations, fiber tracts, transmitters

Cellular and molecular level

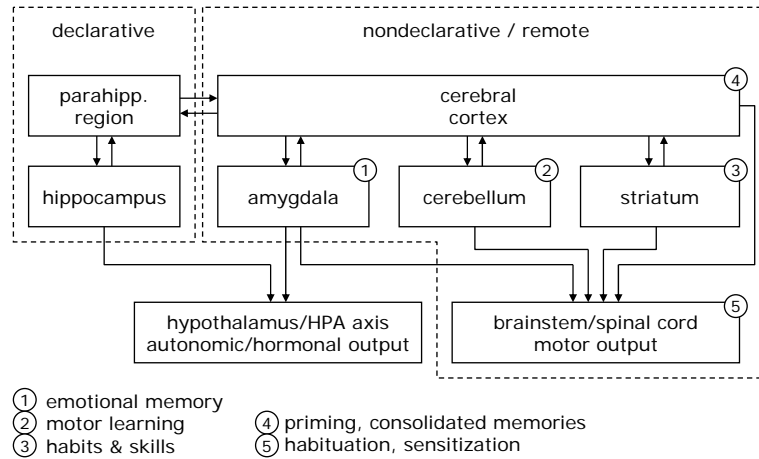

- Role of cellular processes: signaling cascades, protein phosphorylation, protein synthesis, gene expression, cell motility & proliferation
- Role of specific genes, proteins and their interactions

Simulation

- mathematical models, computer simulation
- electronic circuits, robots

Introductory Course in Neuroscience, Wolfer, 16.03.2009

Simplified anatomical framework for memory

Introductory Course in Neuroscience, Wolfer, 16.03.2009

Animal models of nondeclarative memory

Associative

- classical conditioning:
 - fear conditioning (rats, mice - amygdala)
 - conditioned taste aversion (rats, mice – amygdala, cortex)
 - eye blink conditioning (rabbits, mice - cerebellum)
- operant conditioning
 - Skinner box (primates, birds, rats, mice - striatum)
 - Home cage testing environments (mice)

Nonassociative

- motor skill learning
 - rotarod, beam walking (rats, mice - cerebellum, striatum)
- habit learning
 - dry land and water mazes (rats, mice - striatum)
- habituation, sensitization
 - startle reflex (rats, mice - brainstem)

Introductory Course in Neuroscience, Wolfer, 16.03.2009

Animal models of declarative memory

- species differences! lack of language in animals!
- declarative memory defined indirectly through dependence on hippocampus
- no fully established model of episodic memory: "episodic-like" memory

Spatial memory

- place navigation in water-maze (rat, mouse)
- 8-arm radial maze (rat, mouse)
- T-maze alternation (rat, mouse)

Modified conditioning models

- contextual fear conditioning (rat, mouse)
- trace fear or eye blink conditioning (rabbit, rat, mouse)
- home cage testing environments (mouse)

Other models

- object recognition, D(N)MS = delayed (non) matching to sample (rat, primate)
- social recognition, social transmission of food preferences (rat, mouse)
- paired-associate tasks (rat, primates)
