Contents

- ① *Introduction*
 - definition, processes
 - short and long-term memory
- ② *Types of long-term memory*
 - declarative memory
 - nondeclarative memory
- ③ *Amnestic syndrome*
 - anterograde, retrograde amnesia
 - patient H.M.
- ④ *Experimental investigation*
 - levels of analysis
 - compartmentalization of memory systems
- ⑤ *Animal models*
 - of nondeclarative memory
 - of declarative memory

Processes in learning and memory

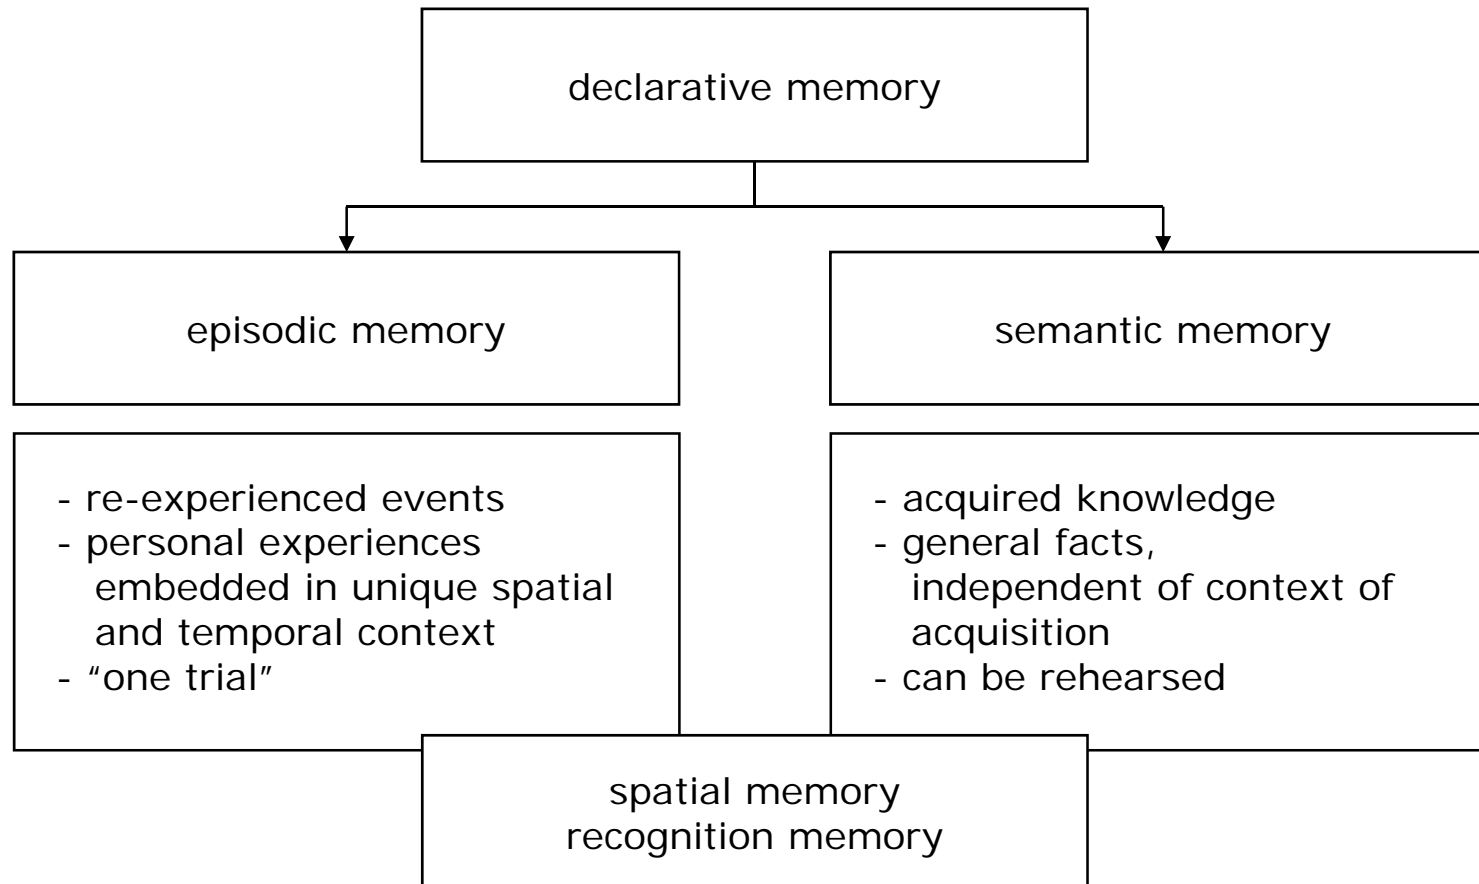

Declarative and nondeclarative memory

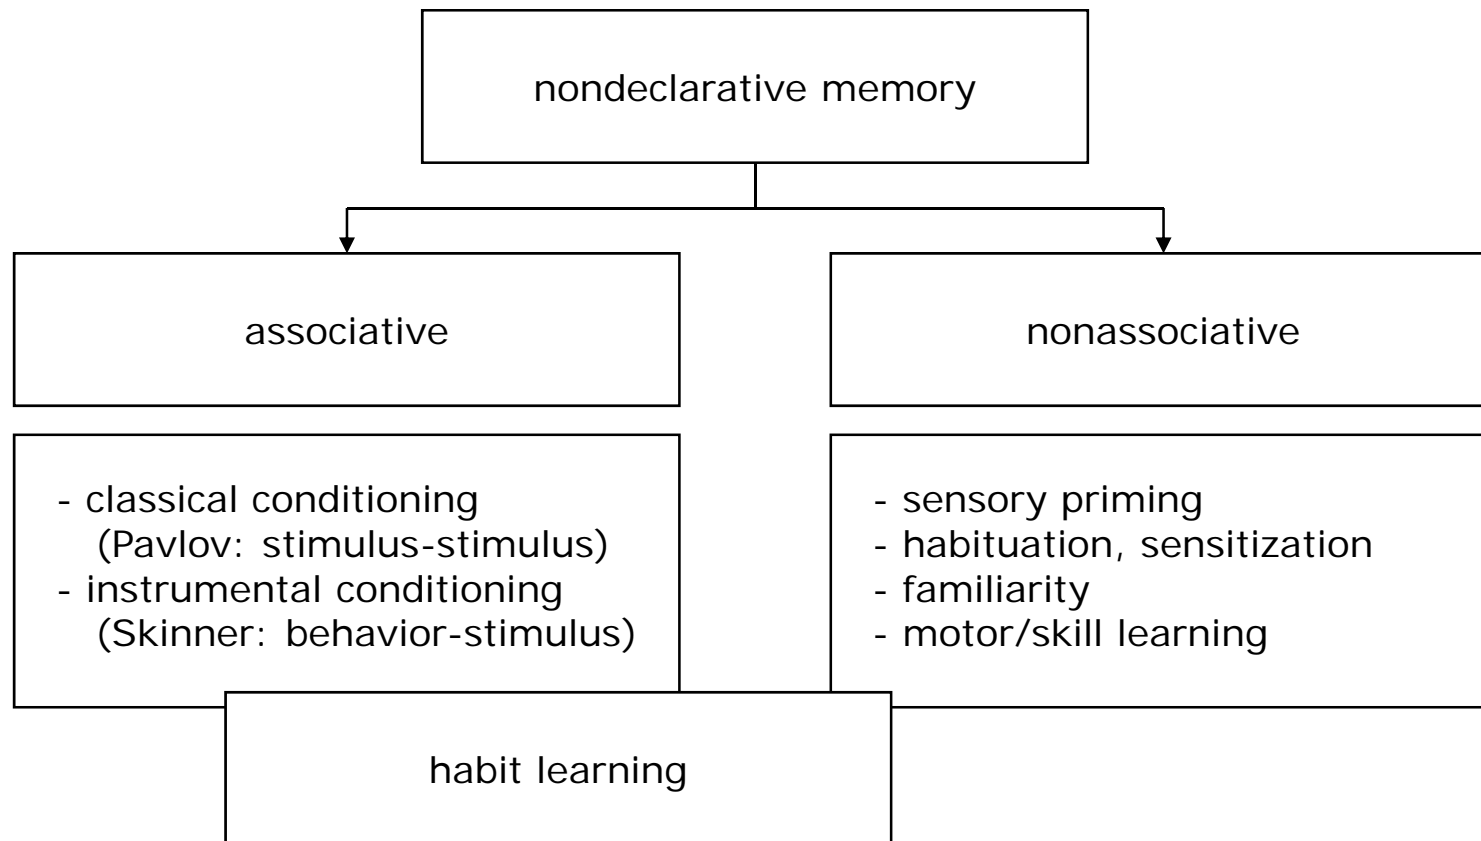

Often activated simultaneously!

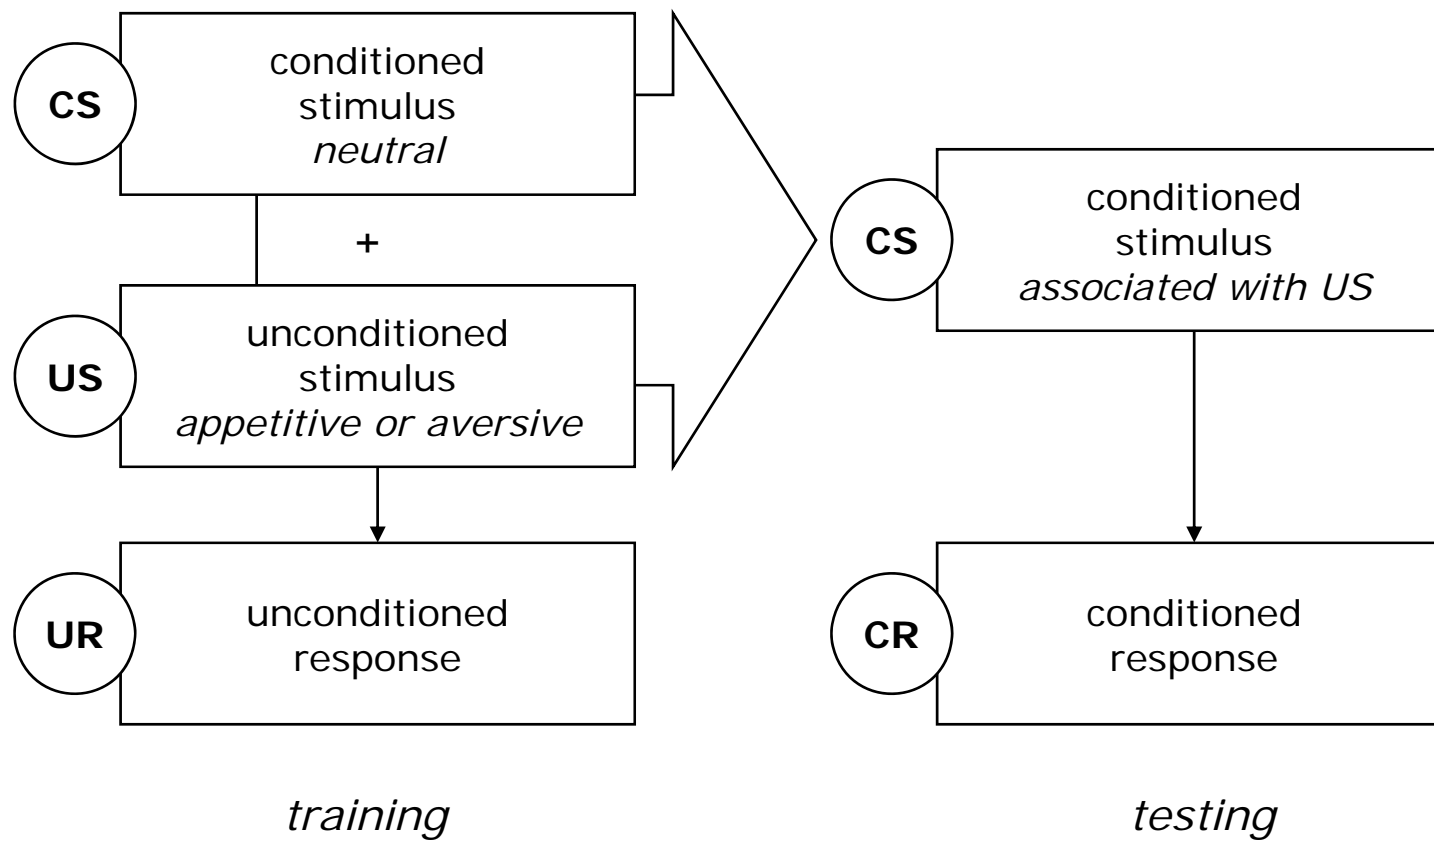

Types of declarative memory

Types of nondeclarative memory

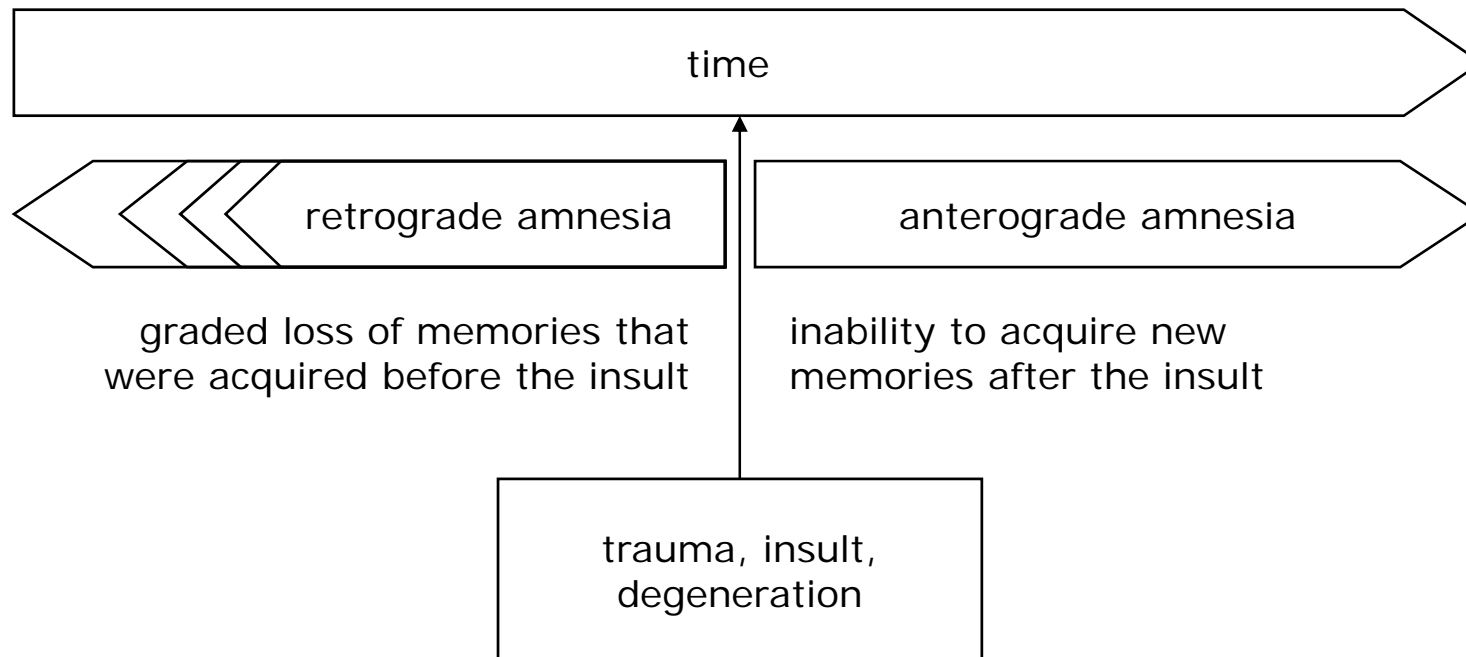

Classical (Pavlovian) conditioning

Amnestic syndrome

*= loss of declarative memory function,
with preserved short-term and nondeclarative memory*

Patient H.M.

- 1926-2008
- 1933 knocked down by bicycle
- development of uncontrollable epilepsy
- 1953 bilateral medial temporal lobe resection by William Scoville

Result:

- Seizures less frequent and controllable
- Severe amnesic syndrome:
 - complete anterograde amnesia
 - retrograde for <15y before surgery
 - nondeclarative memory spared
 - short-term memory spared
 - IQ and language normal
 - cooperative, very placid temper

Levels of analysis

Psychological level

- distinction und definition of various types of memory
- description of their properties, formalization
- models and learning theories, subject as „black box“

Systemic level

- compartmentalization and localization to different brain areas
- role of particular cell populations, fiber tracts, transmitters

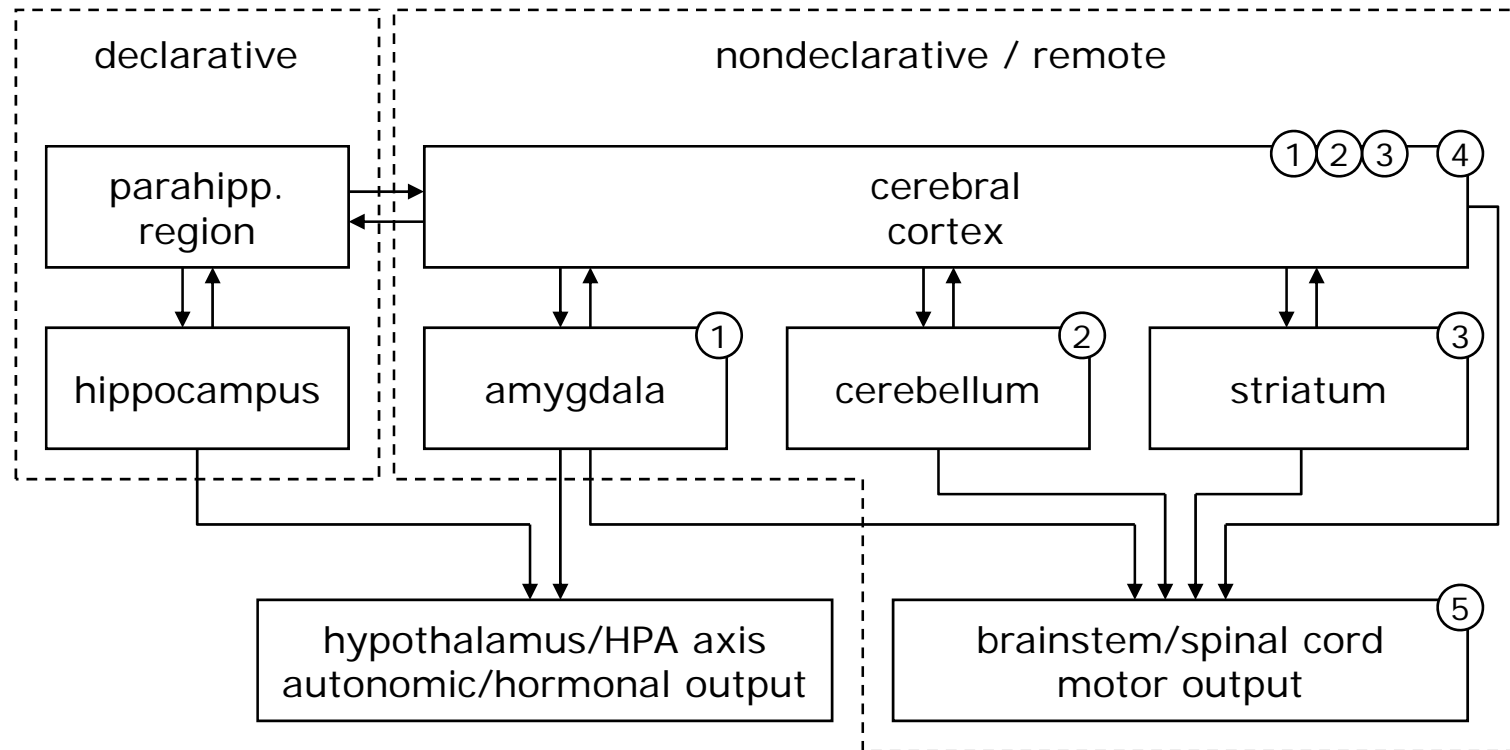

Cellular and molecular level

- Role of cellular processes: signaling cascades, protein phosphorylation, protein synthesis, gene expression, cell motility & proliferation
- Role of specific genes, proteins and their interactions

Simulation

- mathematical models, computer simulation
- electronic circuits, robots

Simplified anatomical framework for memory

- ① emotional memory
- ② motor & skill learning
- ③ motor sequences, operant conditioning, habits

- ④ priming, consolidated memories
- ⑤ habituation, sensitization

Animal models of nondeclarative memory

Associative

- classical conditioning:
 - fear conditioning (rats, mice - amygdala)
 - conditioned taste aversion (rats, mice – amygdala, cortex)
 - eye blink conditioning (rabbits, mice - cerebellum)
- operant conditioning
 - Skinner box (primates, birds, rats, mice - striatum)
 - Home cage testing environments (mice)

Nonassociative

- motor skill learning
 - rotarod, beam walking (rats, mice - cerebellum, striatum)
- habit learning
 - dry & water mazes, Skinner boxes (rats, mice - striatum)
- habituation, sensitization
 - startle reflex (rats, mice - brainstem)

Animal models of declarative memory

- species differences! lack of language in animals!
- declarative memory defined indirectly through dependence on hippocampus
- no fully established model of episodic memory: "episodic-like" memory

Spatial memory

- place navigation in water-maze (rat, mouse)
- 8-arm radial maze (rat, mouse)
- T-maze alternation (rat, mouse)

Modified conditioning models

- contextual fear conditioning (rat, mouse)
- trace fear or eye blink conditioning (rabbit, rat, mouse)
- home cage testing environments (mouse)

Other models

- object recognition, D(N)MS = delayed (non) matching to sample (rat, primate)
- social recognition, social transmission of food preferences (rat, mouse)
- paired-associate tasks (rat, primates)
